ABSTRACT OF THE DISCLOSURE

A server enables a user at a station to scan a
document. The station has a computer connected to the
5   network, a browser installed on the computer to enable
the user to browse the network, and a scanner in
communication with the computer. The server has a
database of scanner drivers, a driver selection system
that enables the user to select a driver for the scanner
10   from the database of scanner drivers, and a delivery
system that transfers a selected driver to the computer
and causes the computer to execute the driver. The user
uses the browser and the driver selection system to
select a driver for the scanner. The delivery system
15   then sends the driver to the computer, and the computer
executes the driver. The driver uses the scanner to
scan a document, and scanning data corresponding to
the document is saved in a predetermined location.
